

Below are the instructions for resetting the service counter for another 6,000 hours:

You can reset it without opening the case by using plastic slotted screwdriver to avoid damaging any components. The suggested tool size is 2mm diameter and at least 10cm in length.

Please take out the filter cap and filter and then using slotted screwdriver to press the black button for 5 secs.

You might need to open the case the first time to see where that button is located on the PCB.
